

PERSONAL EQUITY INVESTMENT & RESEARCH PORTFOLIO

Realised Investments | 2022–Present

A transaction-backed casebook of actual realised investments, reconstructed from the Groww P&L; record and reviewed against contemporaneous company disclosures.

9	Selected cases
₹54,167.80	Capital deployed
₹69,288.63	Sale proceeds
₹15,120.83	Realised profit
27.91%	Combined absolute return

Performance scope: selected realised positions only. The 27.91% figure is capital-weighted and not annualised. It is not CAGR, XIRR, TWR or alpha.

This is a personal research and learning record, not investment advice. The portfolio is designed to demonstrate financial statement reading, evidence-based reasoning and post-investment review.

01 | Research Methodology & Evidence Discipline

The objective is not to rewrite history and make every trade look brilliant. The objective is to document what can be supported, distinguish evidence from inference, and show how the investment process developed.

Transaction source of truth. The Groww workbook determines entry dates, exit dates, quantities, realised P&L; and the realised / unrealised boundary.

Contemporaneous evidence. Purchase rationales are built primarily from annual reports, quarterly results, investor presentations, company releases, offer documents and dated market context that existed at or before the purchase date.

Later information. Used to evaluate the thesis, not to retroactively justify it.

Confidence labels. High means contemporaneous evidence directly supports the claim. Moderate means evidence strongly fits the thesis but the user's original thought is not documented. Low means the available record supports only a limited interpretation.

Sector-specific analysis. Banks are evaluated through NII/NIM, AUM, deposits, asset quality, provisions, capital and liquidity. Industrial and retail businesses are evaluated through revenue, margins, cash generation, working capital, debt and capital allocation. Cyclical require an explicit cycle view. Tactical trades are not disguised as long-term fundamental investments.

What this portfolio deliberately avoids

- Inventing an original thesis that was never recorded.
- Using later earnings as if they were known at the entry date.
- Treating a profitable one-day trade as proof of fundamental forecasting skill.
- Presenting the broker-wide 12.4322% realised P&L; as CAGR, XIRR, TWR or benchmark-relative alpha.
- Using unrealised positions to inflate the realised performance record.

02 | Portfolio Overview

The realised record contains a mix of fundamental, cyclical, turnaround, growth, infrastructure / PSU, IPO-valuation and tactical decisions. The selected nine cases are intended to show the breadth of the process without becoming a catalogue of every transaction.

Case	Realised P&L;	Return	Primary lens
IRFC	₹7,432.80	51.00%	Railway financing / PSU
Vishal Mega Mart	₹6,344.10	90.37%	Mass-market retail
Equitas SFB	₹107.10	17.77%	Banking / SFB
Karnataka Bank	₹2,054.00	48.37%	Private-sector bank
Reliance Power	₹158.50	99.37%	Power / turnaround
Tata Steel	₹124.70	24.36%	Steel / cyclical
RVNL	₹1,335.00	12.34%	Rail infrastructure / tactical
Bajaj Housing Finance	-₹2,562.37	-16.05%	Housing finance / IPO
HFCL	₹127.00	47.96%	Telecom equipment / fibre

Concentration matters: IRFC and Vishal Mega Mart contribute a large portion of the realised result, so the aggregate should not be interpreted as a uniform return generated by every decision.

The cases also show an evolution in process: some decisions appear fundamentally driven, some were tactical, and some reveal the difference between being right about a business and being right about the price paid.

03 | IRFC

Indian Railway Finance Corporation | Railway financing / PSU

Fundamental / sector thesis with repeated add-ons

13-Sep-2023 → 05-Jul-2024	Entry / Exit
₹7,432.80	Realised P&L;
51.00%	Return

Position: 42 @ ₹78.70; additions @ ₹99.90, ₹162.00 and ₹149.60 Exit: ₹188.10

Evidence confidence: HIGH on operating/fundamental context; MODERATE on exact original rationale for each add-on

Investment thesis

Railway-capex expansion and IRFC's role as a specialist system financier created a credible earnings-visibility and rerating thesis. The strongest evidence supports the business and sector thesis; the exact reasoning behind each subsequent purchase is not documented, so the add-ons are treated as separate process questions.

Evidence available at / before entry

- FY23 revenue from operations was about ₹23,891 crore.
- IRFC's role as a dedicated financing vehicle for Indian Railways connected its lending book to long-duration railway financing demand.
- The stock had already risen materially before the 13-Sep-2023 purchase, making valuation and momentum part of the decision context.
- For a lender, the relevant questions include lending-book quality, funding costs, spreads, asset quality and capital structure.

Financial statement & operating review

Metric	Value	Interpretation
FY23 revenue	₹23,891cr	Large recurring financing-income base.
FY24 revenue	₹26,645cr	Growth continued after entry.
FY24 PBT	₹6,412cr	Profitability remained strong.
Railway support FY24	₹2.40 lakh cr	Higher capex created a sector funding tailwind.

Key risks at entry

- Valuation could expand faster than earnings.
- Railway / PSU concentration can create sentiment-driven price moves.
- A rising share price can create false confirmation of the underlying thesis.
- Repeated additions at higher prices require an explicit valuation and thesis-update rule.

What happened

The exit at ₹188.10 locked in gains across four realised lots. The transaction sequence is more informative than the final return because it shows repeated buying into a rising stock.

What I learned

Separate fundamental confirmation from price confirmation. For every future add-on, record the specific new evidence, updated valuation and reason the risk/reward remains attractive.

04 | Vishal Mega Mart

Mass-market retail | Growth + cash generation

Growth / operating-leverage thesis

17-Dec-2024 → 09-Oct-2025	Entry / Exit
₹6,344.10	Realised P&L;
90.37%	Return

Position: 90 @ ₹78 Exit: ₹148.49

Evidence confidence: HIGH on operating evidence; MODERATE on exact original personal thesis

Investment thesis

A rapidly expanding store network, improving profitability, strong operating cash generation and sharply lower financial risk supported a straightforward retail-growth thesis.

Evidence available at / before entry

- FY24 revenue was about ₹8,911.9 crore.
- FY24 PAT was about ₹461.9 crore and CFO about ₹829.7 crore.
- Store count reached 557 in FY24 and 645 by September 2024.
- Borrowings were reported at zero by September 2024.
- H1 FY25 revenue was about ₹5,032.5 crore and PAT about ₹254.1 crore before entry.

Financial statement & operating review

Metric	Value	Interpretation
FY22→FY24 revenue CAGR	~26.3%	Rapid top-line expansion.
FY24 PAT	₹461.9cr	Profitability improved substantially.
FY24 CFO	₹829.7cr	Cash generation exceeded PAT.
Stores	557 FY24 / 645 Sep-24	Physical expansion supported growth.
Borrowings	Zero by Sep-24	Lower funding burden.

Key risks at entry

- Retail competition and price sensitivity can pressure margins.
- Fast store expansion requires inventory discipline and sustained store economics.
- A strong operating business can still disappoint if the entry valuation embeds excessive growth.

What happened

The realised price almost doubled over the holding period. Later FY25 results showed continued growth, but those results are treated as outcome evidence, not entry knowledge.

What I learned

Growth becomes more credible when revenue, profit, cash generation and balance-sheet improvement point in the same direction.

05 | Equitas Small Finance Bank

Banking / SFB | Earnings + asset-quality improvement

Fundamental banking thesis

05-Sep-2023 → 12-Apr-2024	Entry / Exit
₹107.10	Realised P&L;
17.77%	Return

Position: 7 @ ₹86.10 Exit: ₹101.40

Evidence confidence: HIGH on contemporaneous banking evidence; MODERATE on exact original personal reasoning

Investment thesis

The purchase can be supported by a fundamental banking thesis built around strong NII and PAT growth, improving asset quality, expanding deposits and AUM, and a healthy capital buffer.

Evidence available at / before entry

- Q1 FY24 NII was about ₹743 crore, up 28% YoY.
- Q1 FY24 PAT was about ₹191 crore, up 97% YoY.
- GNPA was 2.6%.
- ROA was 2.10% and ROE 14.54%.
- CRAR was 22.06%.

Financial statement & operating review

Metric	Value	Interpretation
NII growth	~28% YoY	Core banking income was expanding.
PAT growth	~97% YoY	Strong earnings momentum.
GNPA	2.6%	Asset quality had improved.
ROA / ROE	2.10% / 14.54%	Healthy profitability at entry.
CRAR	22.06%	Strong capital buffer.

Key risks at entry

- Credit costs could rise and reverse the earnings improvement.
- Deposit competition can raise funding costs and pressure NIM.
- Rapid AUM growth must remain compatible with underwriting quality.

What happened

The stock delivered a positive return over about seven months. Later Q2 FY24 figures showed further AUM and deposit growth, useful for thesis review but not used as entry evidence.

What I learned

For banks, read NII and provisions, asset quality, deposits and advances, capital, and liquidity rather than forcing an industrial-company CFO framework onto a lender.

06 | Karnataka Bank

Private-sector bank | Turnaround / rerating case

Turnaround / fundamental rerating

28-Nov-2025 → 06-Aug-2026	Entry / Exit
₹2,054.00	Realised P&L;
48.37%	Return

Position: 20 @ ₹212.30 Exit: ₹315.00

Evidence confidence: MODERATE. Financial evidence supports the reconstructed thesis; the original thought is not documented.

Investment thesis

A plausible reconstructed thesis is that improving asset quality, profitability, business growth and capital strength could support a rerating of the bank.

Evidence available at / before entry

- Q2 FY26 PAT was about ₹319.1 crore.
- GNPA improved to 3.33% and NNPA was 1.35%.
- CRAR was 20.84%.
- Aggregate business reached about ₹1.76 lakh crore.
- The bank continued to emphasise RAM growth and operating expansion.

Financial statement & operating review

Metric	Value	Interpretation
Q2 FY26 PAT	₹319.1cr	Profitability remained meaningful.
GNPA / NNPA	3.33% / 1.35%	Asset-quality trajectory was improving.
CRAR	20.84%	Strong capital position.
Aggregate business	₹1.76 lakh cr	Scale supported operating leverage.

Key risks at entry

- Credit-cost normalisation could reverse.
- NIM can compress if deposit costs rise faster than lending yields.
- A rerating requires sustainable earnings and ROE improvement, not only a lower starting multiple.

What happened

The position generated a 48.37% realised return over roughly eight months. The case is best understood as a developing turnaround / rerating thesis rather than a claim that every element of the original thesis was formally recorded.

What I learned

A rerating thesis should have a measurable bridge: asset quality → credit costs → profitability → ROA/ROE → valuation.

07 | Reliance Power

Power generation | Turnaround / deleveraging

Turnaround / balance-sheet thesis

22-Aug-2022 → 03-Apr-2024	Entry / Exit
₹158.50	Realised P&L;
99.37%	Return

Position: 10 @ ₹15.95 Exit: ₹31.80

Evidence confidence: MODERATE. Strong contemporaneous operating and deleveraging evidence exists, but the exact original thesis is reconstructed.

Investment thesis

The most defensible entry thesis is a balance-sheet repair and asset-utilisation story: debt reduction combined with high utilisation at major plants could improve financial resilience and create operating leverage if the improvement persisted.

Evidence available at / before entry

- Q1 FY23 total income was ₹2,145 crore and EBITDA ₹858 crore.
- The company reported ₹470 crore of debt repayment in Q1 FY23 and stated it was on track for roughly ₹1,500 crore of debt reduction in FY23.
- Sasan PLF was about 97.4%.
- Rosa availability was about 86%; renewable assets about 93%.
- Net worth was about ₹12,391 crore.

Financial statement & operating review

Metric	Value	Interpretation
Q1 FY23 income	₹2,145cr	Meaningful operating scale.
Q1 FY23 EBITDA	₹858cr	Strong EBITDA despite reported PAT loss.
Debt repayment	₹470cr in Q1	Direct evidence of deleveraging.
Sasan PLF	~97.4%	High asset utilisation.

Key risks at entry

- Leverage and refinancing remained central risks.
- Power-sector economics depend on fuel, tariffs, plant availability and regulation.
- Strong EBITDA does not automatically translate into equity value when interest burden is high.

What happened

The stock nearly doubled over the holding period. The later outcome does not prove that every part of the reconstructed thesis caused the return, but the entry evidence supported a turnaround / deleveraging framework.

What I learned

In leveraged businesses, balance-sheet repair can matter as much as headline PAT. Track debt repayment, interest burden, utilisation and cash generation together.

08 | Tata Steel

Steel | Cyclical recovery + capacity / integration

Cyclical / operating thesis

23-Dec-2022 → 01-Sep-2023	Entry / Exit
₹124.70	Realised P&L;
24.36%	Return

Position: 2 @ ₹102.90 + 3 @ ₹102.00 Exit: ₹127.30

Evidence confidence: HIGH on operating context; MODERATE on exact original thesis

Investment thesis

The entry evidence supported a cyclical recovery thesis with strong Indian operations, the Kalinganagar expansion, the newly completed Neelachal acquisition and a manageable leverage position relative to the earnings base.

Evidence available at / before entry

- Q1 FY23 EBITDA was ₹15,047 crore and PAT ₹7,714 crore.
- Net debt / EBITDA was 0.87x at the end of Q1 FY23.
- Neelachal Ispat Nigam acquisition was completed in July 2022.
- The 5 MTPA Kalinganagar expansion was progressing.
- Q2 FY23 consolidated revenue was ₹59,878 crore and EBITDA ₹6,271 crore.

Financial statement & operating review

Metric	Value	Interpretation
Q1 FY23 EBITDA	₹15,047cr	Strong starting profitability.
Q1 FY23 PAT	₹7,714cr	High earnings base at entry.
Net debt / EBITDA	0.87x	Leverage was manageable at that point.
Kalinganagar	5 MTPA expansion	Future capacity and operating leverage.
Neelachal	Acquired Jul-2022	Integration and ramp-up opportunity.

Key risks at entry

- Steel prices and spreads can reverse quickly.
- Raw-material costs, especially coking coal, can compress margins.
- Large capex and acquisitions increase execution and capital-allocation risk.
- European operations had greater exposure to weaker demand and energy costs.

What happened

The stock generated a moderate gain over about eight months. The thesis was partly a cycle call and partly an execution / integration call, so the outcome depended on commodity conditions and company-specific progress.

What I learned

Cyclicals require an explicit view on what part of the earnings cycle is being bought. Capacity additions and acquisitions matter only if they improve utilisation, margins and cash returns.

09 | RVNL

Rail infrastructure | Tactical trade

Tactical / event-momentum

09-Jul-2024 → 10-Jul-2024	Entry / Exit
₹1,335.00	Realised P&L;
12.34%	Return

Position: 20 @ ₹541.00 Exit: ₹607.75

Evidence confidence: HIGH that this was tactical; LOW for a detailed original fundamental thesis

Investment thesis

The one-day holding period makes a tactical interpretation the most defensible. RVNL's FY24 financial performance and the broader railway-capex narrative formed a supportive backdrop, but the transaction record cannot prove that these fundamentals caused the next-day exit.

Evidence available at / before entry

- FY24 turnover was about ₹21,733 crore.
- FY24 PBT was about ₹1,939 crore and PAT about ₹1,463 crore.
- The railway-infrastructure business had strong government-capex exposure.
- The one-day holding period itself indicates that price / event dynamics mattered more than a long-duration fundamental thesis.

Financial statement & operating review

Metric	Value	Interpretation
FY24 turnover	₹21,733cr	Large execution base.
FY24 PBT	₹1,939cr	Profitability remained strong.
FY24 PAT	₹1,463cr	Strong earnings base.
Holding period	1 day	Supports tactical classification.

Key risks at entry

- Valuation compression after enthusiasm.
- Execution and working-capital intensity.
- Sector sentiment can dominate short-term price formation.

What happened

The stock rose from ₹541 to ₹607.75 in one day, producing a 12.34% realised gain. The result is genuine, but it should not be presented as proof of long-term forecasting skill. FY24 results were scheduled for board consideration on 17-May-2024, before the July entry, so those figures do not introduce hindsight.

What I learned

A profitable trade and a good fundamental investment process are not the same thing. Record the distinction rather than forcing every outcome into one narrative.

10 | Bajaj Housing Finance

Housing finance | IPO valuation / entry-price lesson

IPO / valuation-risk case

16-Sep-2024 → 30-Oct-2024	Entry / Exit
-₹2,562.37	Realised P&L;
-16.05%	Return

Position: 101 @ ₹158.10 Exit: ₹132.73

Evidence confidence: HIGH on documented IPO / market evidence

Investment thesis

The key lesson is not that the business was poor. The risk was paying a market price that embedded extremely high expectations immediately after listing. The case illustrates the distinction between company quality and entry valuation.

Evidence available at / before entry

- IPO offer price was ₹66–₹70; final offer price was ₹70.
- The stock reached a listing-day high around ₹164.64 before the purchase at ₹158.10.
- The company reported strong FY24 profit growth and was the second-largest home-loan provider by assets, making the business story attractive even as valuation risk increased.

Financial statement & operating review

Metric	Value	Interpretation
IPO offer price	₹70	Reference valuation anchor.
Entry price	₹158.10	More than 2.2× offer price.
Listing-day high	~₹164.64	Entry was close to the day's peak.
FY24 profit growth	~38%	Strong momentum, but not sufficient alone to justify any price.

Key risks at entry

- Valuation compression was the immediate equity risk.
- High post-listing expectations can make even good operating results insufficient.
- Housing-finance spreads, borrowing costs and credit quality remain important.

What happened

The stock subsequently fell to ₹132.73, producing the largest selected loss in the casebook.

What I learned

Before buying an IPO or newly listed stock, establish an explicit valuation anchor and ask what future growth the current price already assumes.

11 | HFCL

Telecom equipment & optical fibre | Capacity + product mix

Growth / capex / product-mix thesis

12-Nov-2023 → 12-Apr-2024	Entry / Exit
₹127.00	Realised P&L;
47.96%	Return

Position: 4 @ ₹66.20 Exit: ₹97.95

Evidence confidence: MODERATE. Strong financial evidence supports the thesis; exact original reasoning is reconstructed.

Investment thesis

The evidence supports a telecom-infrastructure thesis in which product mix, optical-fibre demand and capacity investment could support revenue quality and future utilisation, provided capex translated into profitable growth and cash.

Evidence available at / before entry

- FY23 revenue was ₹4,743.31 crore.
- Telecom-products revenue was about ₹2,638 crore.
- FY23 EBITDA was ₹665.86 crore and PAT ₹317.71 crore.
- FY23 CFO was about ₹236 crore, up from about ₹205 crore in FY22.
- The company was investing in optical-fibre capacity, making utilisation and returns on new capacity key monitoring variables.

Financial statement & operating review

Metric	Value	Interpretation
FY23 revenue	₹4,743cr	Large operating base.
Telecom-products sales	₹2,638cr	Product mix was important.
FY23 EBITDA	₹666cr	Healthy operating profit.
FY23 PAT	₹318cr	Positive earnings base.
CFO	~₹236cr	Cash generation improved versus FY22.

Key risks at entry

- Capex can fail to earn adequate returns if utilisation disappoints.
- Telecom spending cycles can create volatility in orders and margins.
- Working capital and execution can weaken cash conversion even when PAT grows.

What happened

The stock generated a 47.96% realised return over five months. Subsequent FY24 results showed higher EBITDA and PAT, supporting parts of the operating thesis, but those later results are outcome evidence only.

What I learned

For capex-led businesses, track the chain: capex → capacity → utilisation → revenue → margin → cash return. Capacity alone is not a thesis.

12 | Portfolio-Level Process Review

The selected realised result is concentrated. IRFC and Vishal Mega Mart are major contributors, so the aggregate should be read alongside the individual case studies rather than as a uniform return across every decision.

₹54,167.80	Capital deployed
₹69,288.63	Sale proceeds
₹15,120.83	Realised profit
27.91%	Combined absolute return

Process lessons

- The portfolio contains multiple decision styles: banking fundamentals, cyclical investing, infrastructure / PSU themes, turnaround thinking, growth retail, IPO valuation risk and tactical trading.
- The strongest future process improvement is documentation: a dated record of why each purchase was made, what changed, and what would invalidate the thesis.
- Add-ons require a higher standard. The IRFC sequence shows why each additional purchase should have a specific reason and valuation check rather than relying on the fact that the stock has already risen.
- Losses can be useful evidence. Bajaj Housing Finance provides a concrete example of why entry valuation matters even when the underlying company has attractive characteristics.
- Cash flow should be interpreted by business model. Vishal Mega Mart, HFCL and Tata Steel allow conventional CFO analysis; banks and financing companies require liquidity, funding, capital and asset-quality analysis.
- Tactical trades should remain labelled tactical. RVNL demonstrates that a profitable one-day trade can be documented honestly without pretending it was a long-term fundamental call.

Performance metric discipline

The broker-reported realised P&L; across the broader transaction record was ₹16,784.40 on realised buy value of ₹1,35,007.05, or 12.4322% as reported by the broker. That figure is not used as the headline performance for the selected nine-case portfolio.

The selected nine-case figure is a capital-weighted aggregate of the completed case studies and is not annualised. The portfolio does not present it as CAGR, XIRR, TWR or alpha.

13 | Selected Case Ledger

Only realised positions are used as performance proof in this portfolio. YES Bank is excluded because it remains a current holding. Other realised transactions were not included in the nine-case deep dive because the portfolio is intended to show representative investment processes rather than every trade.

Case	Realised P&L;	Return	Primary lens
IRFC	₹7,432.80	51.00%	Railway financing / PSU
Vishal Mega Mart	₹6,344.10	90.37%	Mass-market retail
Equitas SFB	₹107.10	17.77%	Banking / SFB
Karnataka Bank	₹2,054.00	48.37%	Private-sector bank
Reliance Power	₹158.50	99.37%	Power / turnaround
Tata Steel	₹124.70	24.36%	Steel / cyclical
RVNL	₹1,335.00	12.34%	Rail infrastructure / tactical
Bajaj Housing Finance	-₹2,562.37	-16.05%	Housing finance / IPO
HFCL	₹127.00	47.96%	Telecom equipment / fibre

Selected nine-case totals

₹54,167.80	Capital deployed
₹69,288.63	Sale proceeds
₹15,120.83	Realised profit
27.91%	Combined absolute return

14 | Source Register & Disclosure

Primary transaction source

Groww Stocks P&L; report: Stocks_PnL_8861367627_17-08-2023_14-09-2026_report.xlsx. The workbook's Trade Level and Scrip Level sheets are the source of transaction facts.

Primary company / regulatory sources used in research

- Indian Railway Finance Corporation: annual reports and investor disclosures.
- Vishal Mega Mart: IPO financial disclosures, H1 FY25 financial information and FY2024-25 annual report.
- Equitas Small Finance Bank: Q1 FY24 investor presentation / earnings materials.
- Karnataka Bank: Q2 FY26 company results / investor disclosures.
- Reliance Power: Q1 FY23 official media release and investor desk.
- Tata Steel: Q1 FY23 and Q2 FY23 official results; FY23 annual report for later context where applicable.
- RVNL: FY24 results / annual-report disclosures.
- Bajaj Housing Finance: DRHP / RHP / prospectus and SEBI filings; contemporaneous IPO reporting.
- HFCL: FY23 results and investor presentations.

Evidence convention

Facts directly supported by company, exchange, regulatory or transaction records are distinguished from research-based interpretation. Where the user's original rationale was not recorded, the document states that limitation directly and does not present an inferred rationale as a recorded fact.

Disclosure

This is a personal investment-research and learning portfolio. It is not investment advice or a recommendation to buy or sell any security. Historical realised outcomes do not establish future performance. Market prices, financial results and company circumstances can change.

Professional positioning

The intended professional use is as a work sample demonstrating self-directed equity research, financial-statement analysis, transaction review, investment reasoning and post-investment learning. The separate interview-preparation document is intentionally excluded.

Currency convention: all monetary values are Indian Rupees (INR).
